

# SD-WAN Solutions Brief

How VMware SD-WAN managed by Involta solves common networking challenges.

## SD-WAN Makes Network Connections Better.

It provides automatic failover and redundant transport paths for communications with an independent secure overlay. It makes traffic flow better and improves business outcomes – all at a lower cost and with simplified central management.

SD-WAN can feel a bit like a magical solution to common networking challenges. When your teams can connect seamlessly, your network security is stronger and you take the next steps toward your digital transformation, you'll open the doors to a wealth of opportunities for growth.

### The Challenge

### VMware SD-WAN's Solution

Managing network connectivity across multiple locations.

SD-WAN's simple and centralized management capabilities allow teams to be redistributed to focus on strategic operations instead of network and traffic management.

WAN management growing expensive and time consuming.

SD-WAN simplifies WAN management by flowing multiple circuits and connections through a single device. An Involta SD-WAN controller will set up and manage your network, making sure everything runs smoothly.

Maintaining security across a multi-cloud environment.

As you move operations to the cloud, security is non-negotiable. When paired with the Involta Security Operations Center (SOC), SD-WAN can improve security at your network edge and in the cloud.

Cloud-based apps with less-than-optimal performance.

Your Involta SD-WAN controller will configure your environment to prioritize traffic according to your business needs.

Invested in WAN circuit and MPLS, but it's not sufficient.

Don't worry. Any recent investments in your network, including MPLS, can be configured into your SD-WAN device. Leveraging multiple connection options is the best way to add redundancies to your network.

## Is SD-WAN the Next Step in Your Digital Transformation?

If you're looking to improve business operations, Involta will help you "Get There." Our team is very excited to roll out our capacity to manage VMware SD-WAN services and looks forward to helping our customers take the next step in their digital transformation.
