Involta Cloud Platform^{SM}

Agility and Freedom in Your Growing Cloud Estate

Today, companies are learning that the cloud helps them drive huge savings in time and costs. But the cloud also introduces a new set of challenges: multi-cloud vendor management, management of consumption, and new security and compliance concerns.

IT teams need ways to provide support for all cloud technology stack layers (IaaS, PaaS, SaaS, etc.) and be able to orchestrate capabilities across all of them in order to deliver resilient, scalable, high performing virtual resources.

The Involta Cloud Platform^{SM} offers a rich set of capabilities that will expand across your entire cloud estate; public, private, and hybrid. It can provide Orchestration, Transformation, Optimization, and Compliance for both new and existing cloud infrastructure.

Orchestration

- Automation is the bedrock of orchestration, which arranges and coordinates automated tasks into a consolidated process or workflow.

- Orchestration helps IT departments preserve the agility and self-service model of the cloud while allowing them to retain control.

Transformation

- Transformation services help organizations get into the cloud quickly and efficiently, whether that involves net-new application deployments, refactoring/modernizing, or lift-and-shift.

- Transformation also helps organizations reduce the time it takes to implement cloud services, increase the speed of development and deployment, and decrease the time and cost to migrate some workloads to the public cloud as well as modernizing others.

Optimization

- Cloud management services that are focused on optimizing cloud deployment include; cost monitoring and metering, consumption management and cost optimization, and remediation.

- Optimization also ensures that cloud benefits are immediately realized. Ongoing optimization efforts would typically require the use of either financial insight and analytics or consumption management and optimization tools. Involta Cloud Platform^{SM} helps provide these insights.

Compliance

- Compliance measures are met through control of people, process, tools, and technology, eliminating exposed risks and elevated costs from unplanned work and shadow IT.

- Cloud management services creates consistent governance procedures across all clouds and regions so that compliance can be achieved as well as improved security and adherence to best practices.
